## 3 Tangent Vectors

### 3.1 Tangent Vectors

**Definition.** Let  $a \in \mathbb{R}^n$ . A **geometric tangent vector** in  $\mathbb{R}^n$  is

$$v_a = (a, v), \text{ for some } v \in \mathbb{R}^n$$

(we sometimes use the notation  $v|_a$ ). We interpret  $v_a$  as a vector  $v$  whose initial point is at  $a$ .

**Definition.** The **geometric tangent space to  $\mathbb{R}^n$  at  $a$**  is the set

$$\mathbb{R}_a^n = \{v_a | v \in \mathbb{R}^n\},$$

where  $a$  is a fixed element of  $\mathbb{R}^n$ .

*Remark.* The set  $\mathbb{R}_a^n$  is a vector space, with the natural operations of addition and scalar multiplication where  $a$  always remains fixed:

$$v_a + w_a = (v + w)_a, \quad c(v_a) = (cv)_a.$$
