Suppose x and y are related variables. So as one changes, the other changes. We can ask:

How much does y change per unit change in x?

Answer: The derivative of y with respect to x tells us, and it depends on the current value of x!

If we write y as a function of x like this: $y = f(x)$, then the derivative is written as

$$\frac{\mathrm{d}y}{\mathrm{d}x} \quad \text{or} \quad \frac{\mathrm{d}f}{\mathrm{d}x} \quad \text{or} \quad f'(x)$$

It is the limit of "average rate of change" over shorter and shorter Δx:

$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$

also known as "instantaneous rate of change"

Why use h to find the derivative?

Without h: $f'(a) = \lim_{x \to a} \frac{f(x) - f(a)}{x - a}$

Here is an example without h. For $f(x) = x^2$, if we wanted to find $f'(2)$ it would be the limit of the average rate of change from 2 to a second point x as that second point approaches 2.

Why use h to find the derivative?

Without h: $f'(a) = \lim_{x \to a} \frac{f(x)-f(a)}{x-a}$

Here is an example without h. For $f(x) = x^2$, if we wanted to find $f'(2)$ it would be the limit of the average rate of change from 2 to a second point x as that second point approaches 2.

$$\lim_{x \to 2} \frac{x^2 - 2^2}{x - 2}$$

Why use h to find the derivative?

Without h: $f'(a) = \lim\limits_{x \to a} \frac{f(x)-f(a)}{x-a}$

Here is an example without h. For $f(x) = x^2$, if we wanted to find $f'(2)$ it would be the limit of the average rate of change from 2 to a second point x as that second point approaches 2.

$$\lim_{x \to 2} \frac{x^2 - 2^2}{x - 2} = \lim_{x \to 2} \frac{(x-2)(x+2)}{(x-2)}$$

Why use h to find the derivative?

Without h: $f'(a) = \lim_{x \to a} \frac{f(x)-f(a)}{x-a}$

Here is an example without h. For $f(x) = x^2$, if we wanted to find $f'(2)$ it would be the limit of the average rate of change from 2 to a second point x as that second point approaches 2.

$$\lim_{x \to 2} \frac{x^2 - 2^2}{x - 2} = \lim_{x \to 2} \frac{(x-2)(x+2)}{(x-2)} = \lim_{x \to 2} x + 2$$

Why use h to find the derivative?

Second example: For $g(x) = x^3$, if we wanted to find $g'(5)$ it would be the limit of the average rate of change from 5 to a second point x as that second point approaches 5.

Why use h to find the derivative?

Without h: $f'(a) = \lim_{x \to a} \frac{f(x)-f(a)}{x-a}$

Here is an example without h. For $f(x) = x^2$, if we wanted to find $f'(2)$ it would be the limit of the average rate of change from 2 to a second point x as that second point approaches 2.

Second example: For $g(x) = x^3$, if we wanted to find $g'(5)$ it would be the limit of the average rate of change from 5 to a second point x as that second point approaches 5.

$$\lim_{x \to 5} \frac{x^3 - 5^3}{x - 5}$$

Why use h to find the derivative?

Without h: $f'(a) = \lim_{x \to a} \frac{f(x)-f(a)}{x-a}$

Second example: For $g(x) = x^3$, if we wanted to find $g'(5)$ it would be the limit of the average rate of change from 5 to a second point x as that second point approaches 5.

$$\lim_{x \to 5} \frac{x^3 - 5^3}{x - 5} = \lim_{x \to 5} \frac{(x-5)(x^2 + 5x + 5^2)}{(x-5)}$$

Why use h to find the derivative?

Without h: $f'(a) = \lim_{x \to a} \frac{f(x)-f(a)}{x-a}$

Here is an example without h. For $f(x) = x^2$, if we wanted to find $f'(2)$ it would be the limit of the average rate of change from 2 to a second point x as that second point approaches 2.

A= 0.1 B= 5.01 C= 5.05 D= 5.1 E= 5.2

Standard Estimation Problem

Question: Approximate $\sqrt{26}$.

A= 0.1 B= 5.01 C= 5.05 D= 5.1 E= 5.2

Some tools: For $g(x) = \sqrt{x}$, $g'(25) = 1/10$ and $g(25) = \sqrt{25} = 5$.

Standard Estimation Problem

Question: Approximate $\sqrt{26}$.

A= 0.1 B= 5.01 C= 5.05 D= 5.1 E= 5.2 D

Some tools: For $g(x) = \sqrt{x}$, $g'(25) = 1/10$ and $g(25) = \sqrt{25} = 5$.

Standard Estimation Problem

Question: Approximate $\sqrt{26}$.

A= 0.1 B= 5.01 C= 5.05 D= 5.1 E= 5.2 D

Some tools: For $g(x) = \sqrt{x}$, $g'(25) = 1/10$ and $g(25) = \sqrt{25} = 5$.

Better estimate: $\sqrt{26} \approx 5.09902$, so the error in the tangent line approximation here is

$$\text{error} \approx 5.1 - 5.09902 \approx 0.001$$

This is a percentage error of only 0.02%.

Another Example:

- $f(t)$ = number of grams of a chemical reagent after t seconds
- We're told $f(0) = 20$ and $f'(0) = -3$

Question: Roughly how many grams are there after t seconds?

A$= 4 - 3t$ B$= 20 - 3t$ C$= 20 - 4t$ D$= 20 + 4t$ E$= 32 - 3t$

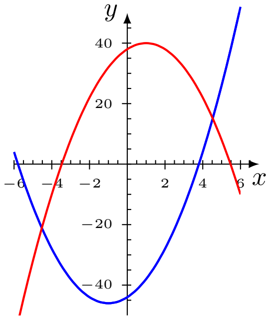
Answer: B

Sketching some simple graphs

It's useful to be able to sketch…

(1) Quadratics



$y = 2x^2 + 4x - 44$

$y = -2x^2 + 4x + 38$

- $y = ax^2 + bx + c$
- Bowl-shaped:
  - ⋆ Opens up if $a > 0$
  - ⋆ Opens down if $a < 0$
- Model curve: $y = x^2$

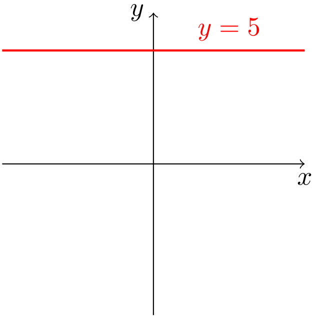
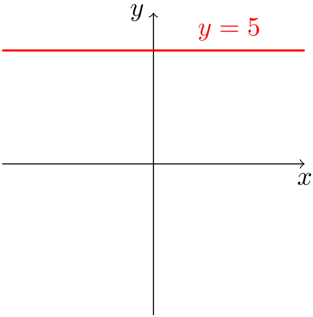
The Derivatives of Simple Functions



The derivative of a constant is...?

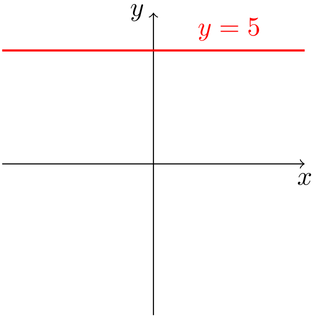
The Derivatives of Simple Functions



The derivative of a constant is zero because:

- derivative = rate of change
- constants don't change

The Derivatives of Simple Functions

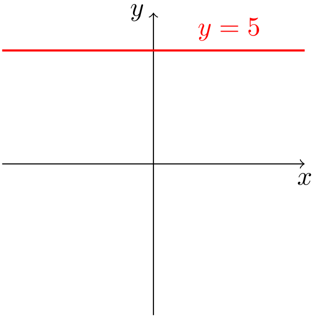


The derivative of a constant is zero because:

- derivative = rate of change
- constants don't change

- derivative = slope
- slope = 0

The Derivatives of Simple Functions



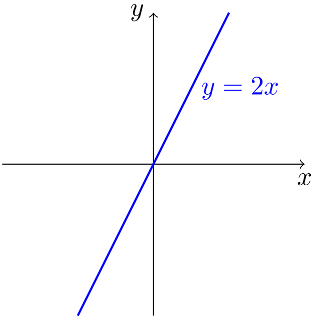
The derivative of a constant is zero because:

- derivative = rate of change
- constants don't change

- derivative = slope
- slope = 0

So $\dfrac{d}{dx}(5) = 0$

The Derivatives of Simple Functions



The derivative of a constant is zero because:

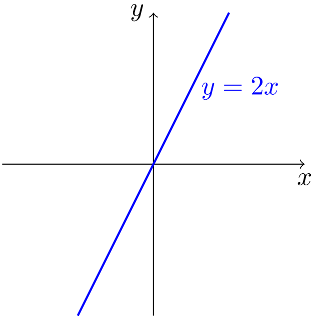
- derivative = rate of change
- constants don't change

- derivative = slope
- slope = 0

So $\frac{d}{dx}(5) = 0$

The derivative of a straight line is. . . ?

The Derivatives of Simple Functions



The derivative of a constant is zero because:

- derivative = rate of change
- constants don't change

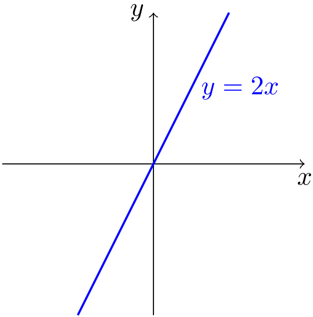
- derivative = slope
- slope = 0

So $\dfrac{d}{dx}(5) = 0$

The derivative of a straight line is its slope because

- derivative = slope

The Derivatives of Simple Functions



The derivative of a constant is zero because:

- derivative = rate of change
- constants don't change

- derivative = slope
- slope = 0

So $\dfrac{d}{dx}(5) = 0$

The derivative of a straight line is its slope because

- derivative = slope

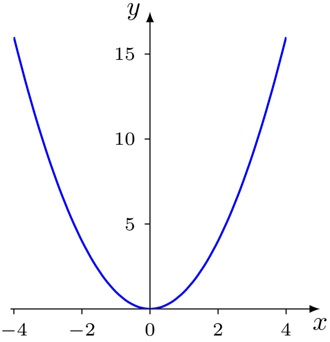
So $\dfrac{d}{dx}(2x) = 2$

Meaning of Derivatives

$$\boxed{\frac{d}{dx}\left(x^2\right) = 2x}$$

What this means

The slope of the graph of $y = x^2$ at $x = a$ is $2a$

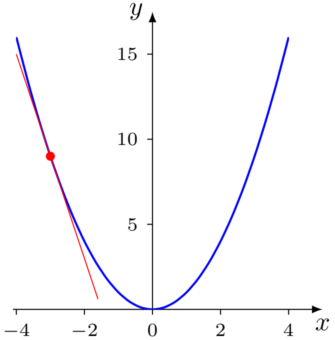


Meaning of Derivatives

$$\frac{d}{dx}\left(x^2\right) = 2x$$

What this means

The slope of the graph of $y = x^2$ at $x = a$ is $2a$



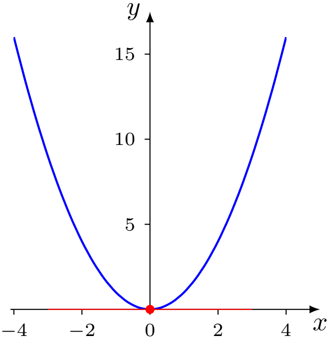
at $x = -3$, slope is $2(-3) = -6$

Meaning of Derivatives

$$\frac{d}{dx}\left(x^2\right) = 2x$$

What this means

The slope of the graph of $y = x^2$ at $x = a$ is $2a$



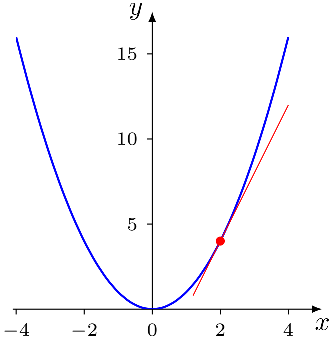
at $x = 0$, slope is $2(0) = 0$

Meaning of Derivatives

$$\boxed{\frac{d}{dx}\left(x^2\right) = 2x}$$

What this means

The slope of the graph of $y = x^2$ at $x = a$ is $2a$



at $x = 2$, slope is $2(2) = 4$

Meaning of Derivatives

$$\frac{d}{dx}\left(x^2\right) = 2x$$

Bingo!

The Meanings of Derivatives

The derivative of $f(x) = x^2 + 3x + 1$ is $f'(x) = \frac{df}{dx} = 2x + 3$. This means:

- This is the slope of the graph $y = x^2 + 3x + 1$ at the point x

The Meanings of Derivatives

The derivative of $f(x) = x^2 + 3x + 1$ is $f'(x) = \frac{df}{dx} = 2x + 3$. This means:

- This is the slope of the graph $y = x^2 + 3x + 1$ at the point x
- It is the instantaneous rate of change of $f(x)$ at x.

The Meanings of Derivatives

The derivative of $f(x) = x^2 + 3x + 1$ is $f'(x) = \frac{df}{dx} = 2x + 3$. This means:

- This is the slope of the graph $y = x^2 + 3x + 1$ at the point x
- It is the instantaneous rate of change of $f(x)$ at x.

That $f'(2) = 7$ means:

- The slope of the graph $y = f(x)$ at $x = 2$ is 7.

The Meanings of Derivatives

The derivative of $f(x) = x^2 + 3x + 1$ is $f'(x) = \frac{df}{dx} = 2x + 3$. This means:

- This is the slope of the graph $y = x^2 + 3x + 1$ at the point x
- It is the instantaneous rate of change of $f(x)$ at x.

That $f'(2) = 7$ means:

- The slope of the graph $y = f(x)$ at $x = 2$ is 7.
- The slope of the tangent line to the graph at $x = 2$ is 7.

The Meanings of Derivatives

The derivative of $f(x) = x^2 + 3x + 1$ is $f'(x) = \frac{df}{dx} = 2x + 3$. This means:
